- 5. Conclusion

#### 1. Model Based MDP (MB-MDP)

Hitachi High-Tech

- Model Based MDP (MB-MDP) has been used for EB shot reduction and speed-up of mask writing time.
   By allowing overlapping shots, EB shot count can be
  - significantly reduced.

#### From http://www.ebeam.org/home

Problem of overlapping shot verification *Hitachi High-Tech* 

- Usually, EB shot data verification is done before mask writing
  - This process is called Mask Rule Check (MRC)
- However, MB-MDP shots are not identical to mask target. So, new methods are needed to verify the MB-MDP shots.

#### MRC methods for overlapping shots

Hitachi High-Tech

In this presentation, we introduce two methods for verification of overlapping EB shots using GPGPU.

- Comparison of simulated contour images between conventional shots and MB-MDP shots
- Overdose detection

#### 2. GPU computing and its benefits

Hitachi High-Tech

One of the greatest merits of GPU computing is its speed.

- Currently many technologies of high speed computation based on GPUs have been reported.
- Especially, an excellent program development environment called CUDA enables to build such high performance programs easily.

Architecture of CPU and GPU

CPU has a single cache memory and controller and no more than 4 or 6 cores. On the other hand, GPU can have multiple cache memory and controllers, and more than one hundred cores.

GFLOP comparison (CPU vs GPU)

## Merit of GPU – low power consumption Hitachi High-Tech

Another major merit of GPU is low power consumption.

- Comparison of GFLOP per Watt
  - ➢ GPU is much better than CPU
- Computational lithography technologies need great amount of CPU powers.
  - Total reduction of power consumption is needed.

In this study, we develop GPU computing techniques for faster and greener MRC

3. Key points of GPU computing

#### Hitachi High-Tech

- Need to pay high attention to optimal memory usage.
  - Shared memory small (16k), but very fast
  - Global memory large (1G), but very slow

We applied multiple Gaussian filtering method for energy distribution calculation.

#### Contour generation

#### Contour generation flow

## Hitachi High-Tech

#### **Program Architecture**

## Hitachi High-Tech

- We use the API (Application Program Interface) function of SmartMRC as the fundamental framework of the software development and evaluation.
  - By using the API function of SmartMRC, programmers can access to the mask layout data easily without knowing the details of the mask data format.

**API mechanism of SmartMRC** 

**Program architecture** 

### 4. Experimental results

- Hitachi High-Tech
- We evaluated new MRC system with 2 types of data.
- The specs of the system is as follows:

CPU	: Intel® Xeon® CPU E5645 @ 2.40GHz X 2				
	Core number	: 24 logical cores			
GPU	: Tesla C2050 / C2070				
	Core number	: 448 CUDA Cores			
	Global-memory size	: 2.64 Gbyte			
	GPU Clock-speed	: 1.15 GHz			
	Constant-memory size	: 64 Kbyte			
	Shared-memory per block	: 48 Kbyte			
	Register count per block	: 32,768			

## Dumbbell type data (DB)

#### Hitachi High-Tech

Dumbbell type data – array of dumbbell shape with height=400nm and width= 40/160nm.

Results					
Processing	Power				
time	consum				

Туре	Processing time	Power consumption
GPU	1,258 s	130 Wh
CPU	5,460 s	300 Wh

#### -4 times faster

- 2.3 times smaller power consumption

## 5. Conclusion

#### Hitachi High-Tech

- We have proposed novel verification methods for MB-MDP shots using GPU computing techniques.
- We have achieved X4-5 faster speed and X2.3-3.4 smaller power consumption compared to conventional CPU methods.
- Future plans
  - System development for actual mask production
  - Further improvement of basic algorithm for faster calculation

This study is a joint work of AIST (Advanced Industrial Science and Technology) and Hitachi High-Tech Science Corporation.
